Pivot Mounts

The EAW pivot mounts are available for all common bolt action rifles. Various adjustment possibilities guarantee a tension-free fit of the scope, which makes it possible to mount and dismount the scope – or a second scope – as often as you like without any change in zero.

The lock snaps in automatically. The XS version is recommendable for heavy calibres when used with heavy scopes.

The EAW pivot mount with lever is optimal for break-open rifles and multiple-barrel guns. Due to its low height, it blends integrated into the rifle.

When the scope has been removed, it is possible to use the open sights without any problems. The locking lever is put down manually. Suitable models for rifles with integrated prism rail, blind plates and solid rail are available.

For an easier mounting, the new version is equipped with a steplessly adjustable lever.

Slide-on and Roll-off Mounts

This type of mount is the ideal solution for small calibre rifles and airguns, but also for all hunting guns with integrated prism rail or prism plates.

The scope can easily be removed and put on again. These inexpensive mounts are of course manufactured with the same precision as the top model - the pivot mounts. One-piece or two-piece types are available.

Mounts for Blaser R 93 (Single Parts)	123

Claw Mounts

Collectors of traditional weapons often prefer this classical type of mount. If the claw mount is fitted by an experienced gunsmith, it guarantees a constant point of impact and optimal repeatability of zero.

The lock snaps in automatically. In most cases a second scope cannot be used.
